the Milky
Way galaxy ...

Reference Points

☆ Celestial Equator

🌍 Projection of Earth's equator

☆ Celestial Poles

🌍 Projections of Earth's poles

☆ Point of Aries

🌍 Vernal Equinox

🌍 Defines prime meridian
(Celestial Greenwich)

Celestial Coordinates

☆ Right Ascension

- 🌐 RA or α
- 🌐 From prime meridian (0^h) to $23^h59^m59^s$ Eastward

☆ Declination

- 🌐 Dec or δ
- 🌐 From celestial equator (0°) to poles N & S 90°

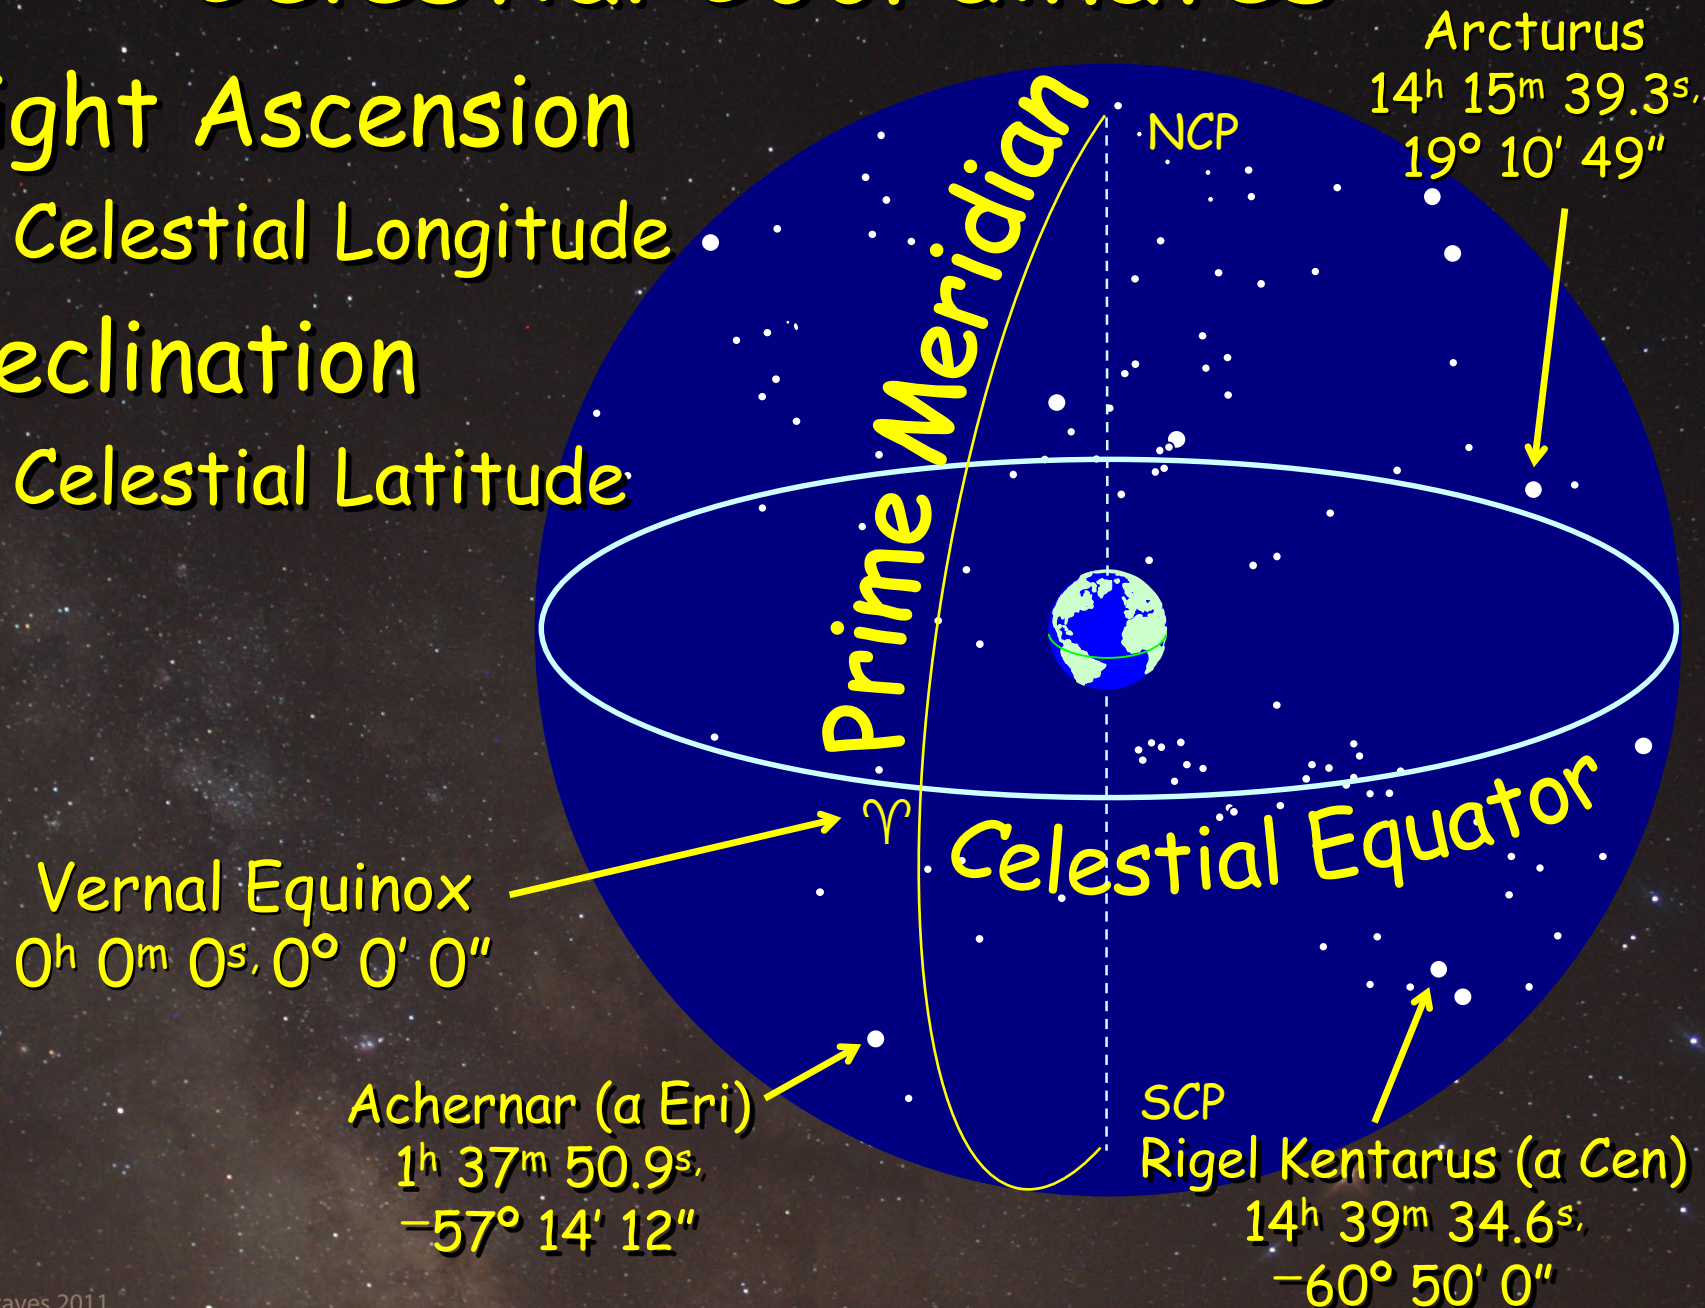

Celestial Coordinates

☆ Right Ascension

🌐 Celestial Longitude

☆ Declination

🌐 Celestial Latitude

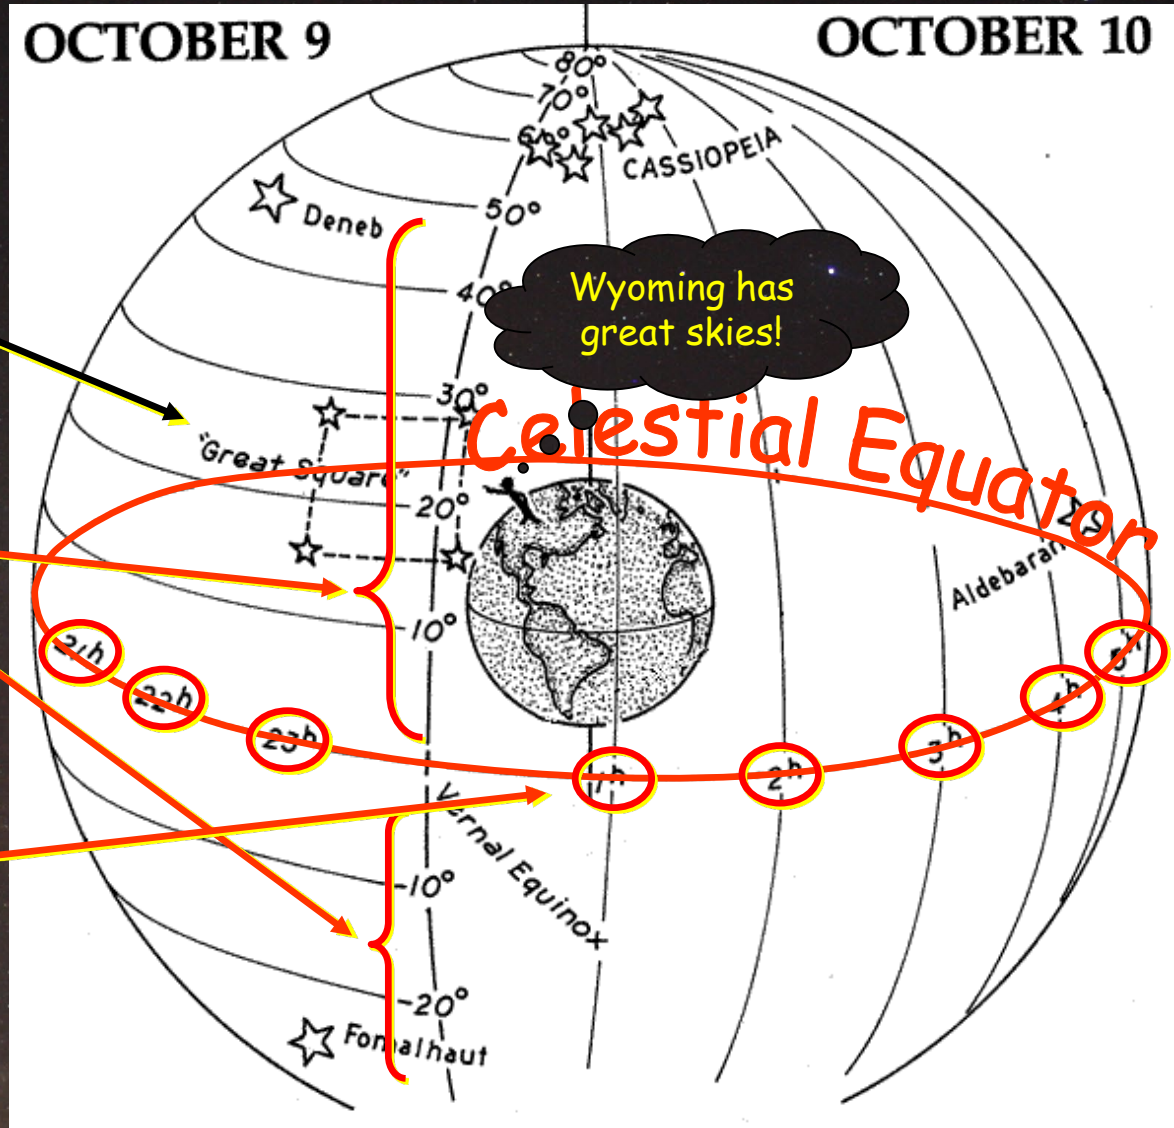

Celestial Coordinates

☆ Chet Raymo: 365 Starry Nights: October

Earth observer in North America looking up at Great Square of Pegasus (an asterism)

Degrees of Declination:
Positive (N) 0° to $+90^\circ$
Negative (S) 0° to -90°

Hours of Right Ascension
 0^h to 24^h

Wyoming has great skies!

Celestial Equator

Observers On Earth

☆ See different sky depending on Latitude

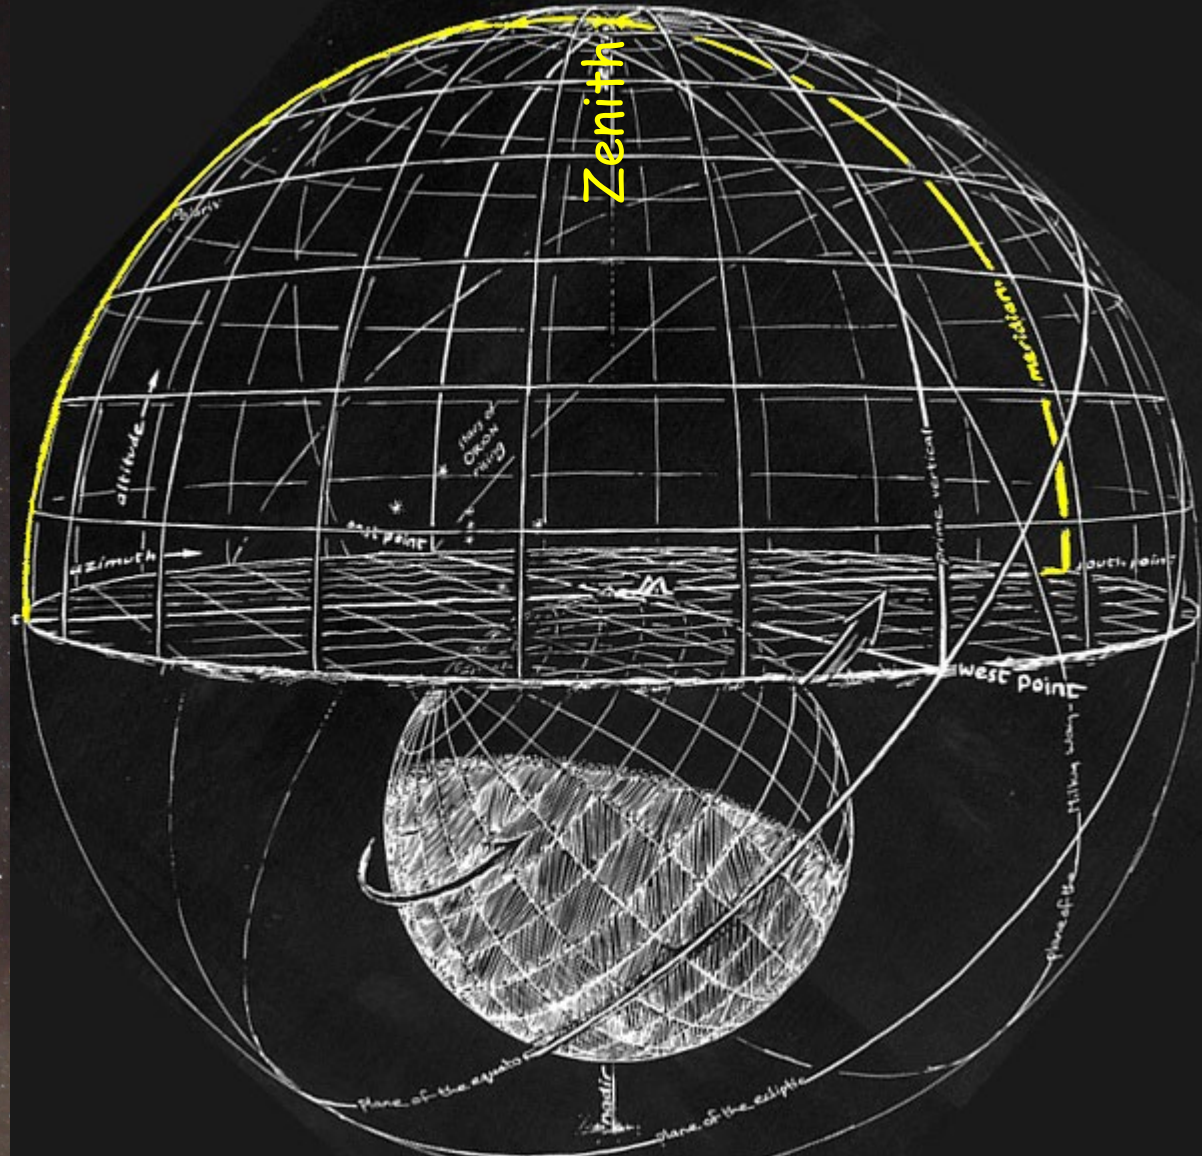

Tilted Sky

☆ Observers see sky "tilted" due to latitude

We see ourselves "on top" of the Earth, beneath the sky.

So we see sky motions tilted

Viewing the Sky

- ☆ Observers see celestial reference points at angles related to their latitude

Sky Angles

Altitude & Azimuth

☆ Position of an object in the sky

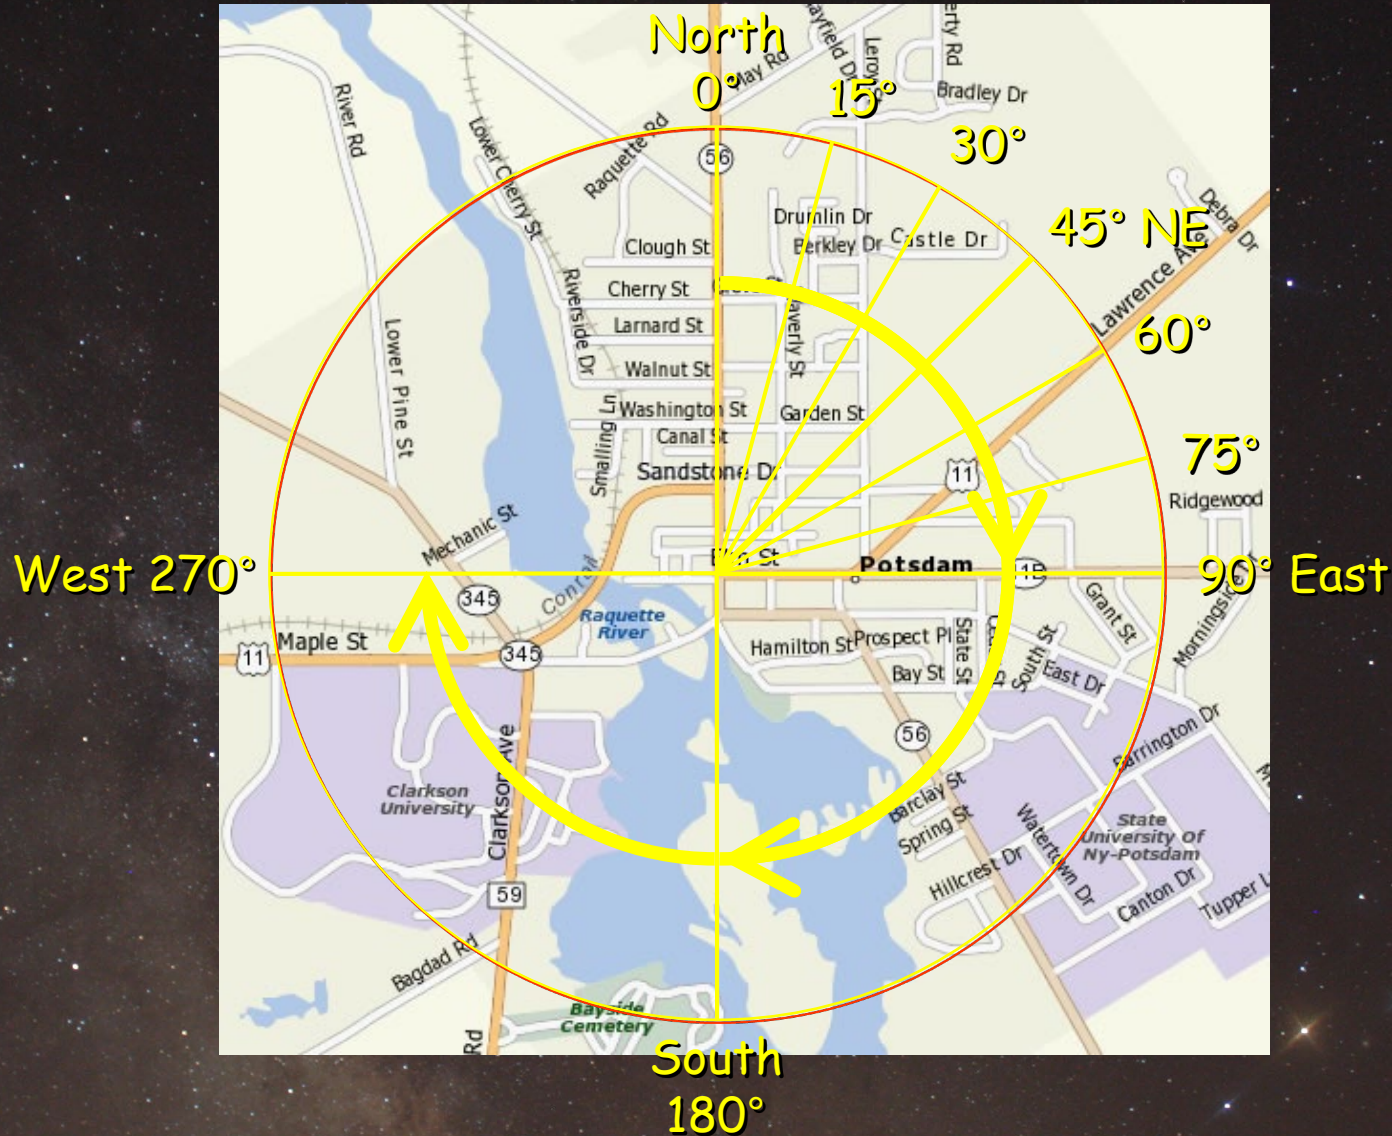

🌍 Azimuth = Angle from north through east

🌍 Altitude = Angle from horizon to object

Azimuth

☆ Angle from North through East

St. Lawrence University
North
0°

15°

30°

45° NE

60°

75°

90° East

West 270°

South
180°

Horizon Coordinate System

Horizon Coordinate System

Question

What's the observer's latitude?

a) 70° N

b) 20° N

Question

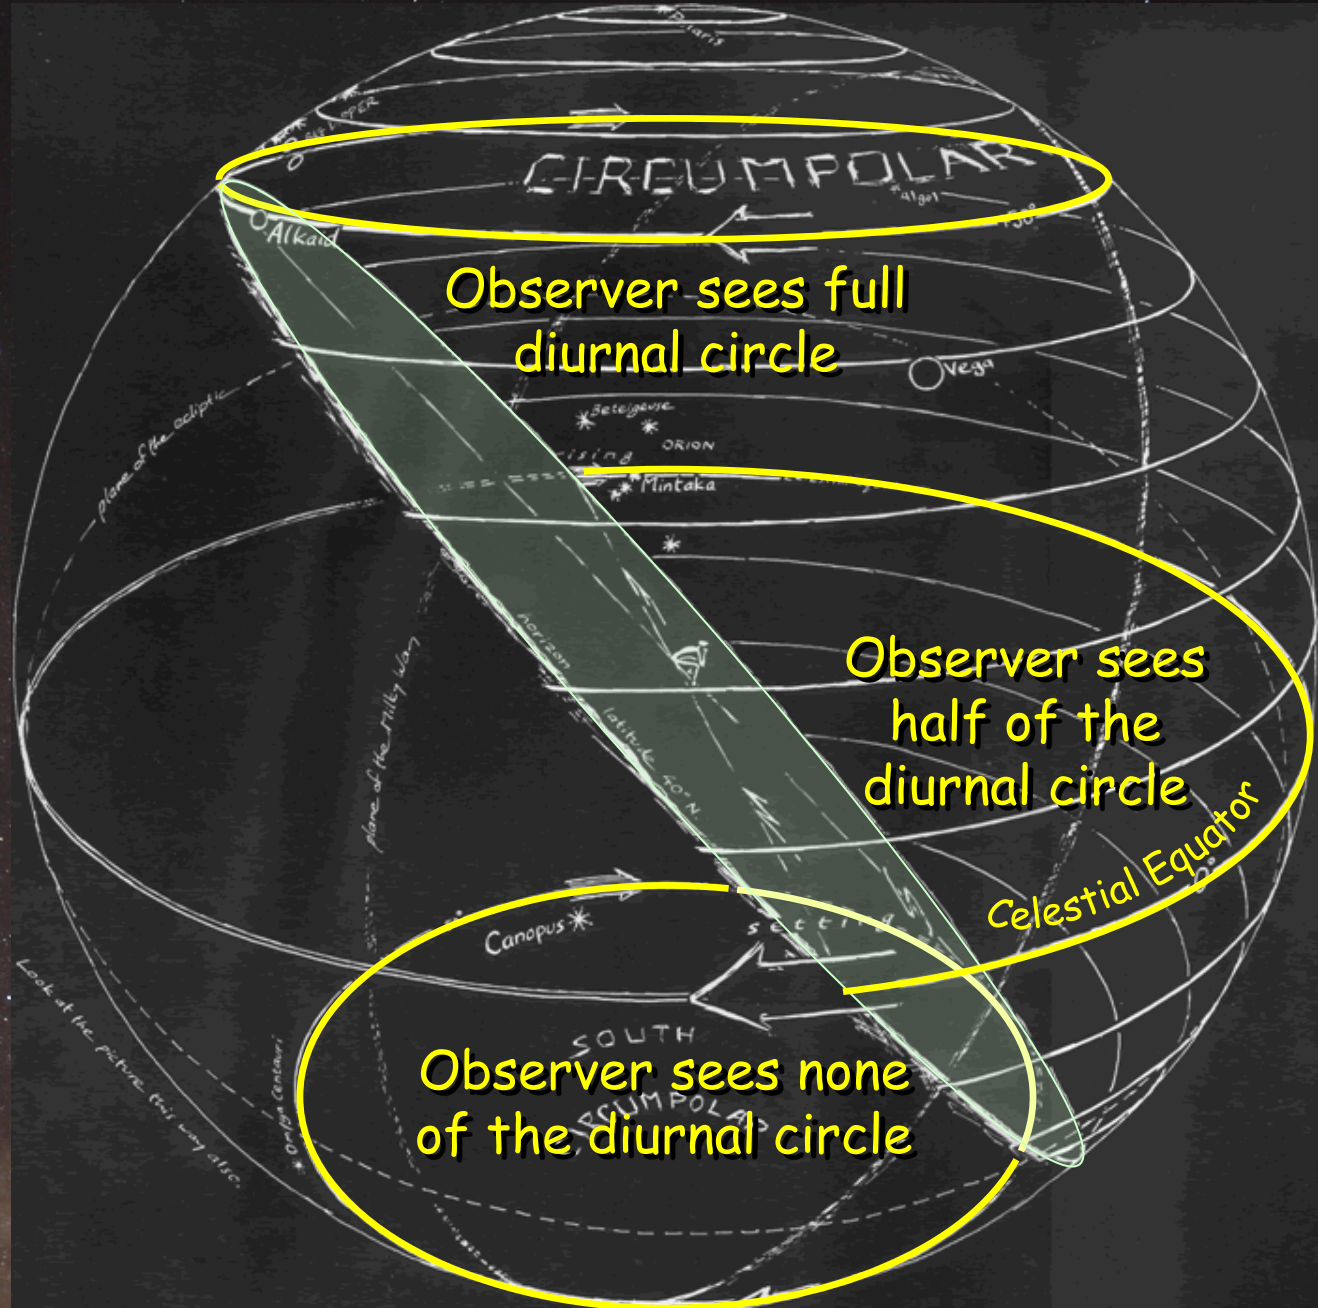

What's the observer's latitude?

a) 60° N

b) 30° N

Diurnal Circles

- ☆ Each celestial object circles the observer each day
- ☆ Observer sees part of each circle

View of Observer

Rotate into the observer's frame of reference

Stars NEVER visible

View of Observers

☆ Diurnal circles are parallel to CE

🌍 Stars rise and set at CE's angle from horizon

Star Paths

☆ Each travels a diurnal circle

🌍 Portion of diurnal circle above horizon determines time object is "up"

All paths parallel to celestial equator

Question

Which observer(s) would see the star travel on the diurnal circle shown?

a)

b)

North

Question

Which observer(s) would see the star travel on the diurnal circle shown?

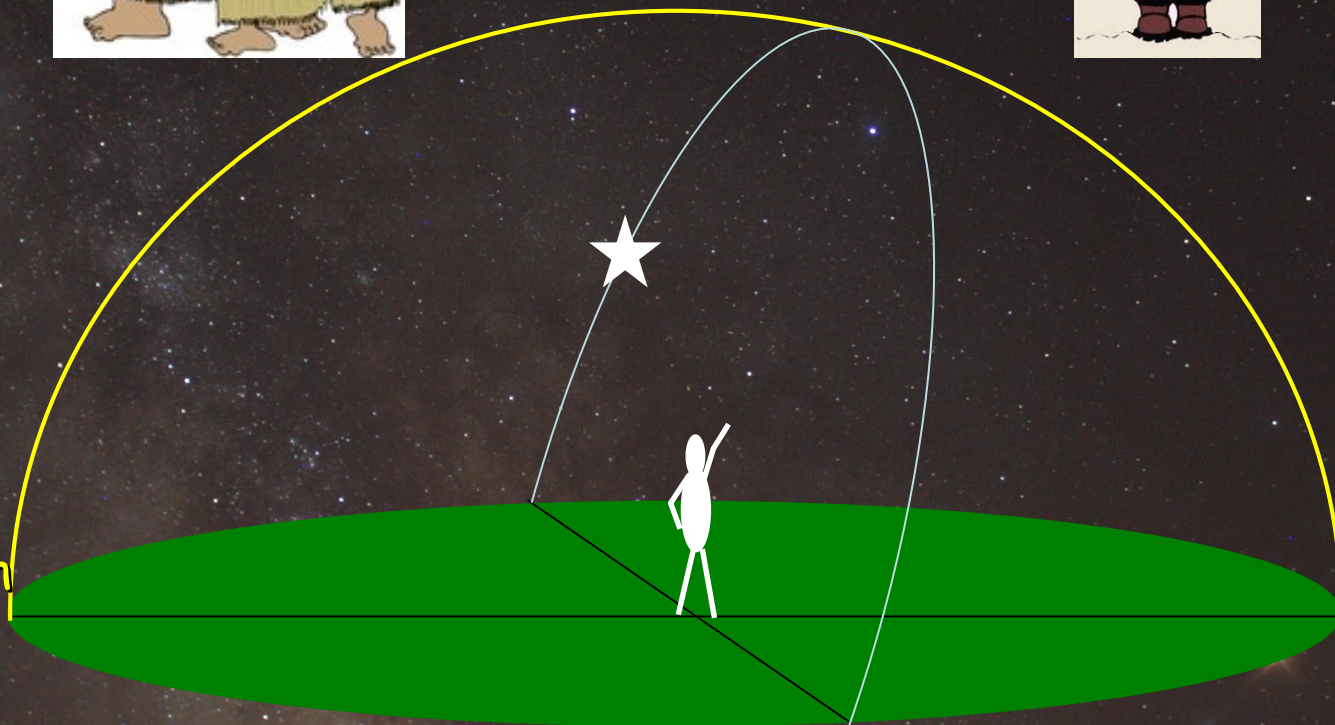

a)

b)

North

Time of day

☆ Earth Rotates Once Each Day

① 360° with respect to Earth-Sun line

② All Earthlings ride along

→ To Sol

Sunrise, Sunset ...

☆ Everything in the sky (sun, moon, stars, etc.)

🌍 Rises in the east

🌍 Sets in the west

each day

Measuring Circles:

$$360^\circ = 24 \text{ hr}$$

$$15^\circ = 1 \text{ hr}$$

Each hour, the sun moves
15 degrees in the sky

$$1^\circ = 4 \text{ min} \quad \text{or} \quad 15' = 1 \text{ min}$$

Every 4 minutes, the sun moves
1 degree = 60' in the sky

Observer's View of the Day

- ☆ Sun rises in east,
moves 15° /hour from East to West
transits at noon
sets in west

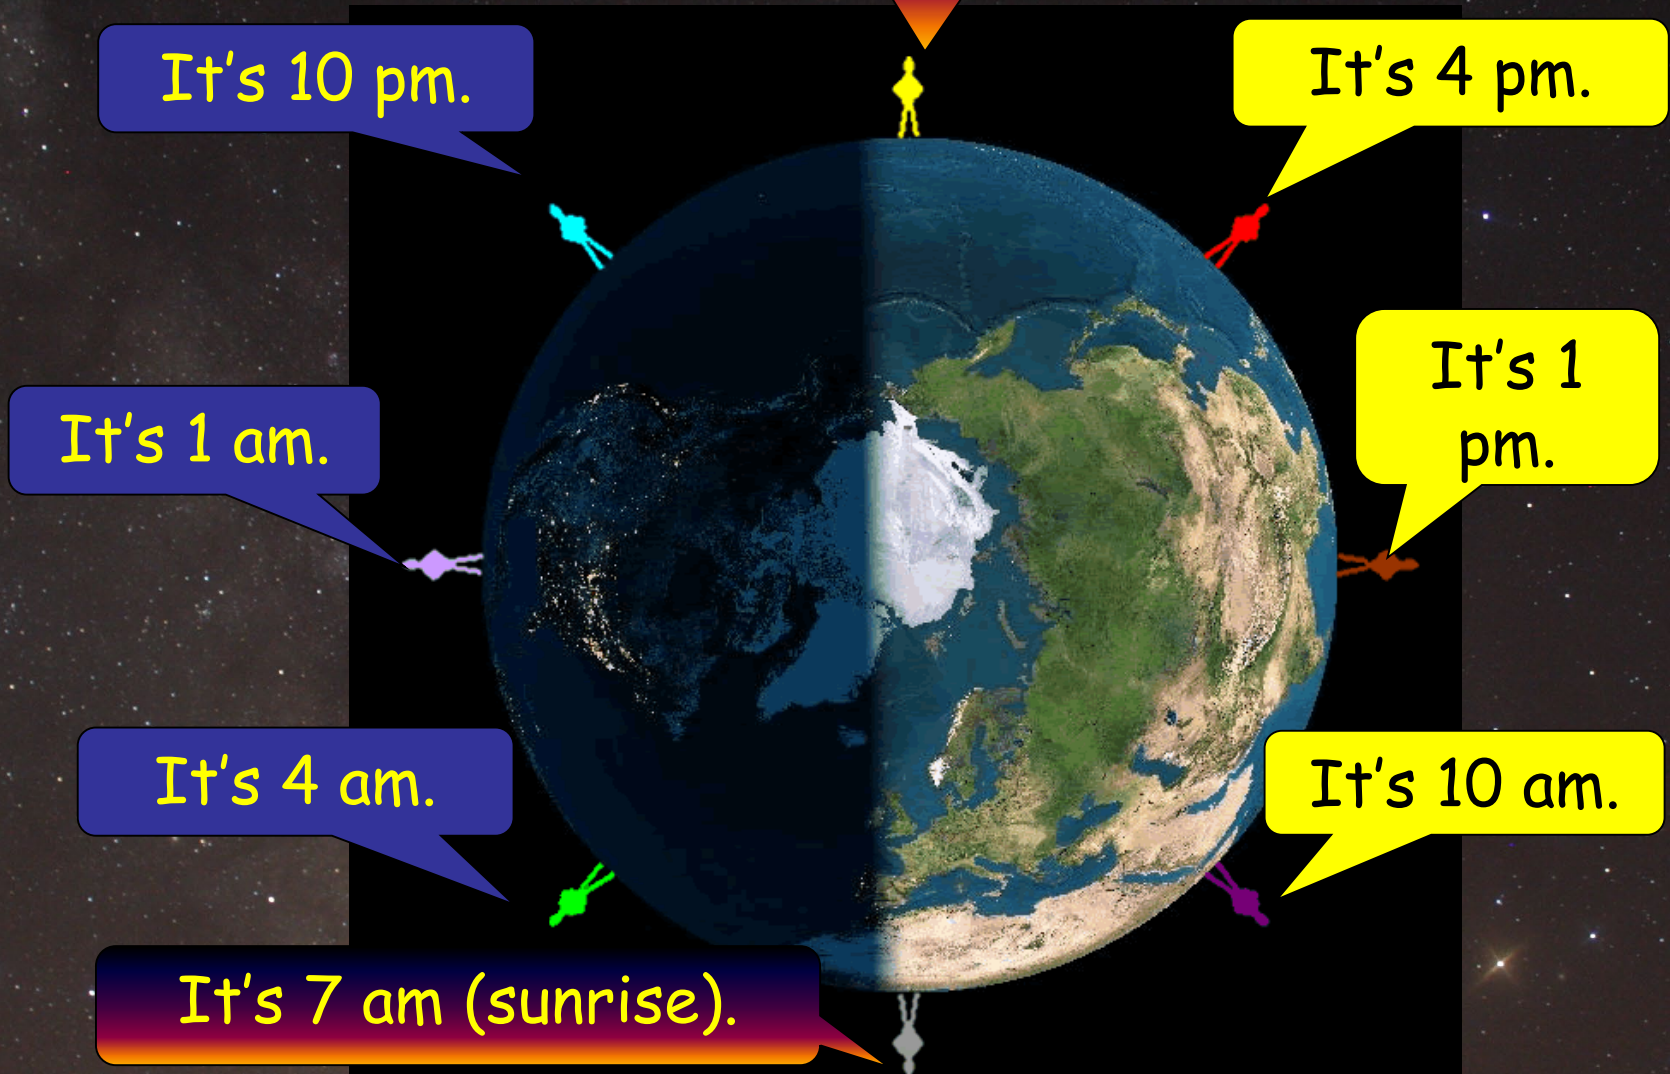

Standard Clock Time

☆ Every Longitude at different time

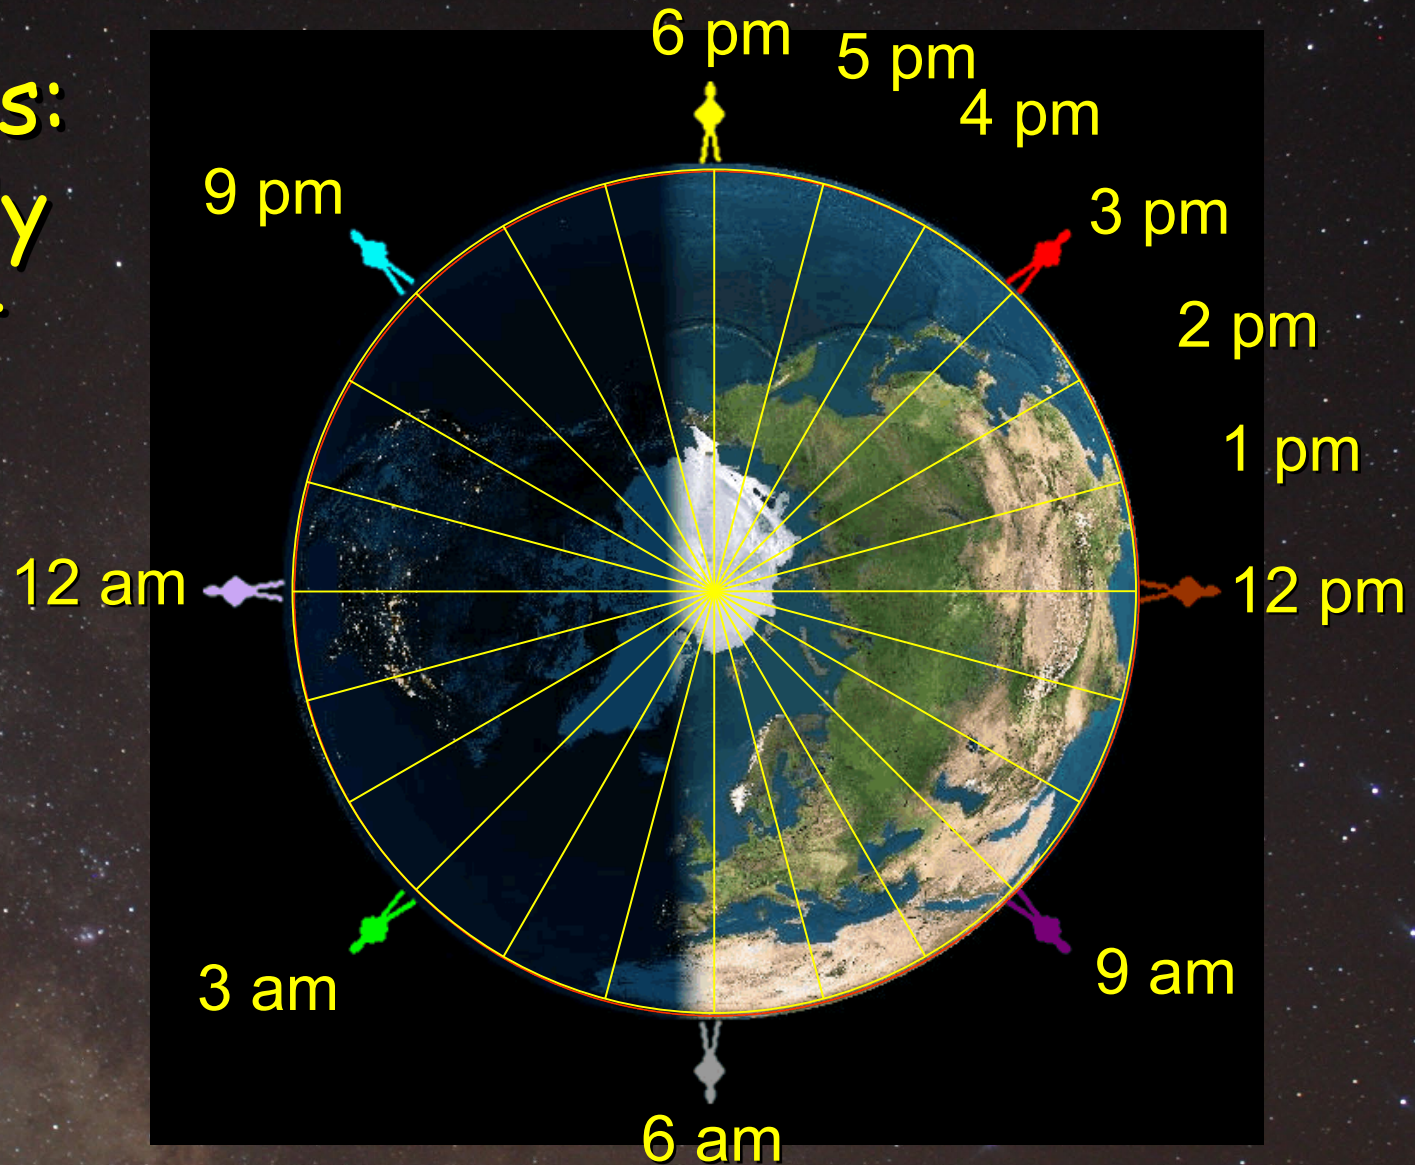

Daylight Saving Time

☆ Shifts times one hour (USNO Explanation)

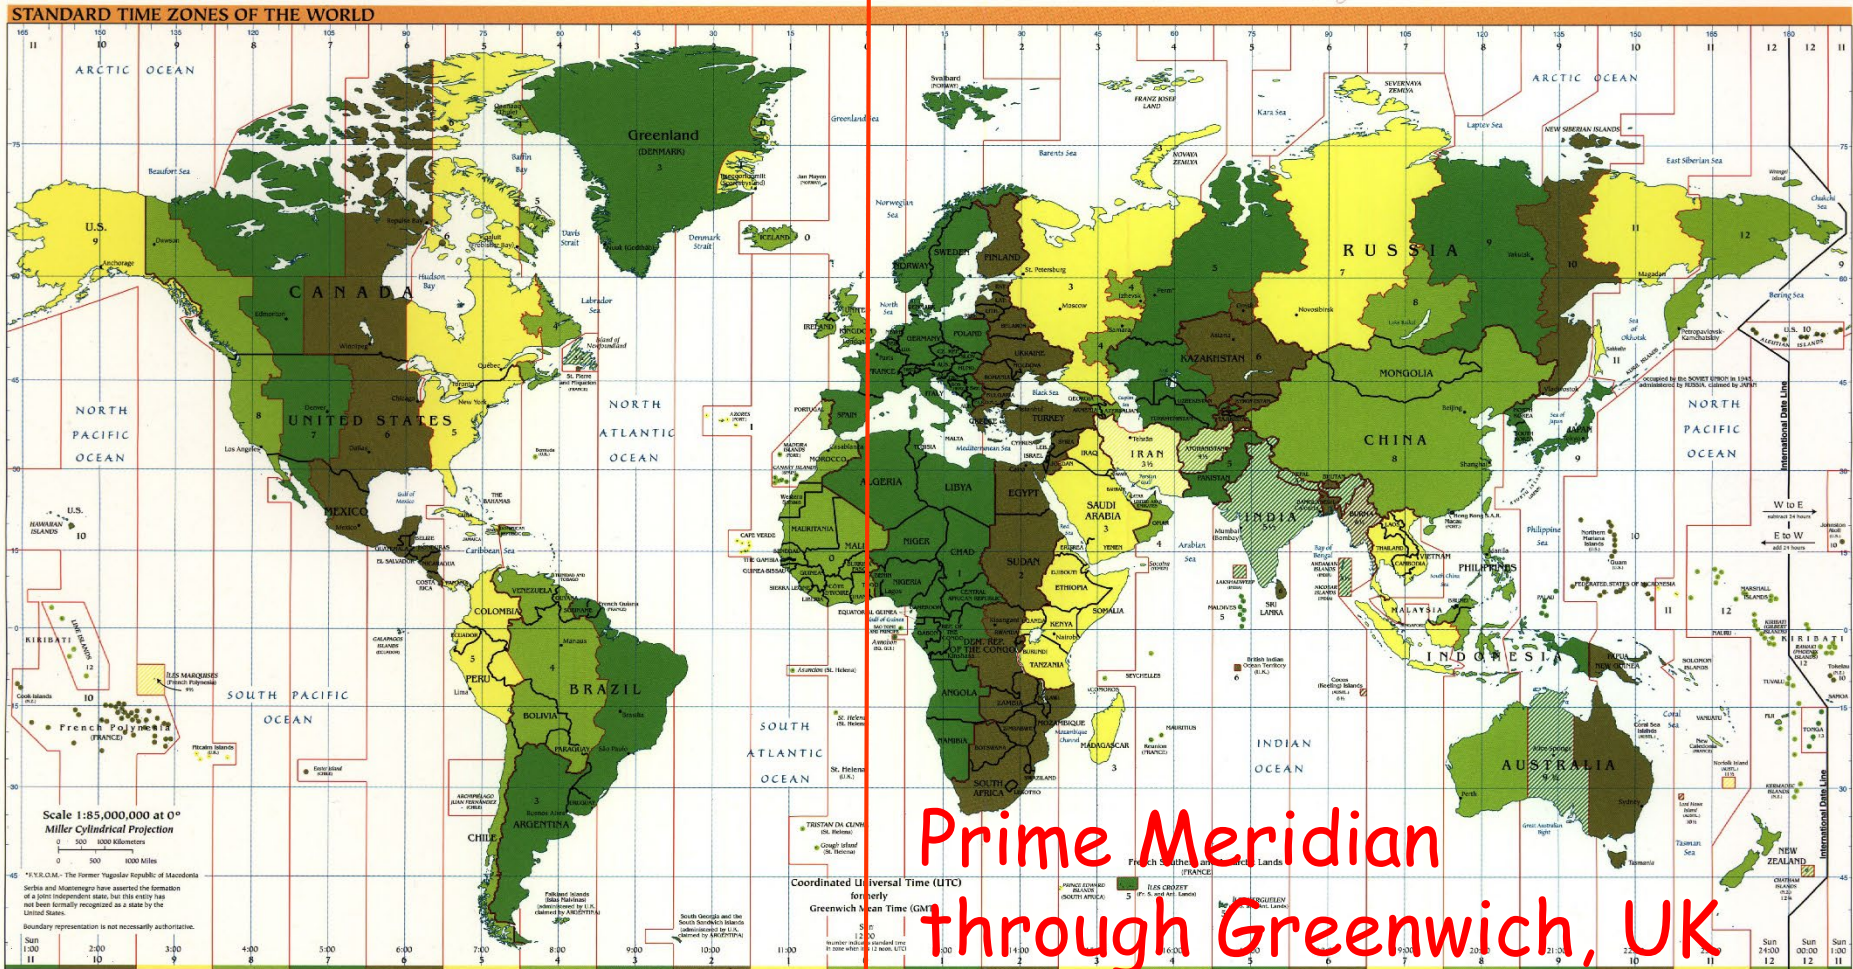

Clock Time

Time Zones:
24, roughly
 15° apart

STANDARD TIME ZONES OF THE WORLD

New Year arrival Times in EST:

7 pm London

8 pm E. Greenland, Azores, Cape Verde

9 pm S. Ga. & Sandwich Is.

10 pm E. Brazil, Argentina, W. Greenland

Greenland

10:30 pm Newfoundland

11 pm Labrador, P.R., E. Brazil, Chile, et

AOD's New Year's Celebration at 9 pm EST!

Coordinated Universal Time

☆ UTC (UT or Zulu)

🌐 Time at Greenwich

› no Daylight saving

☆ Conversion

🌐 EST (Eastern Standard Time) = UTC - 5hr

› eg. 2pm (14:00) EST = 19:00 UT

🌐 EDT (Eastern Daylight Time) = UTC - 4hr

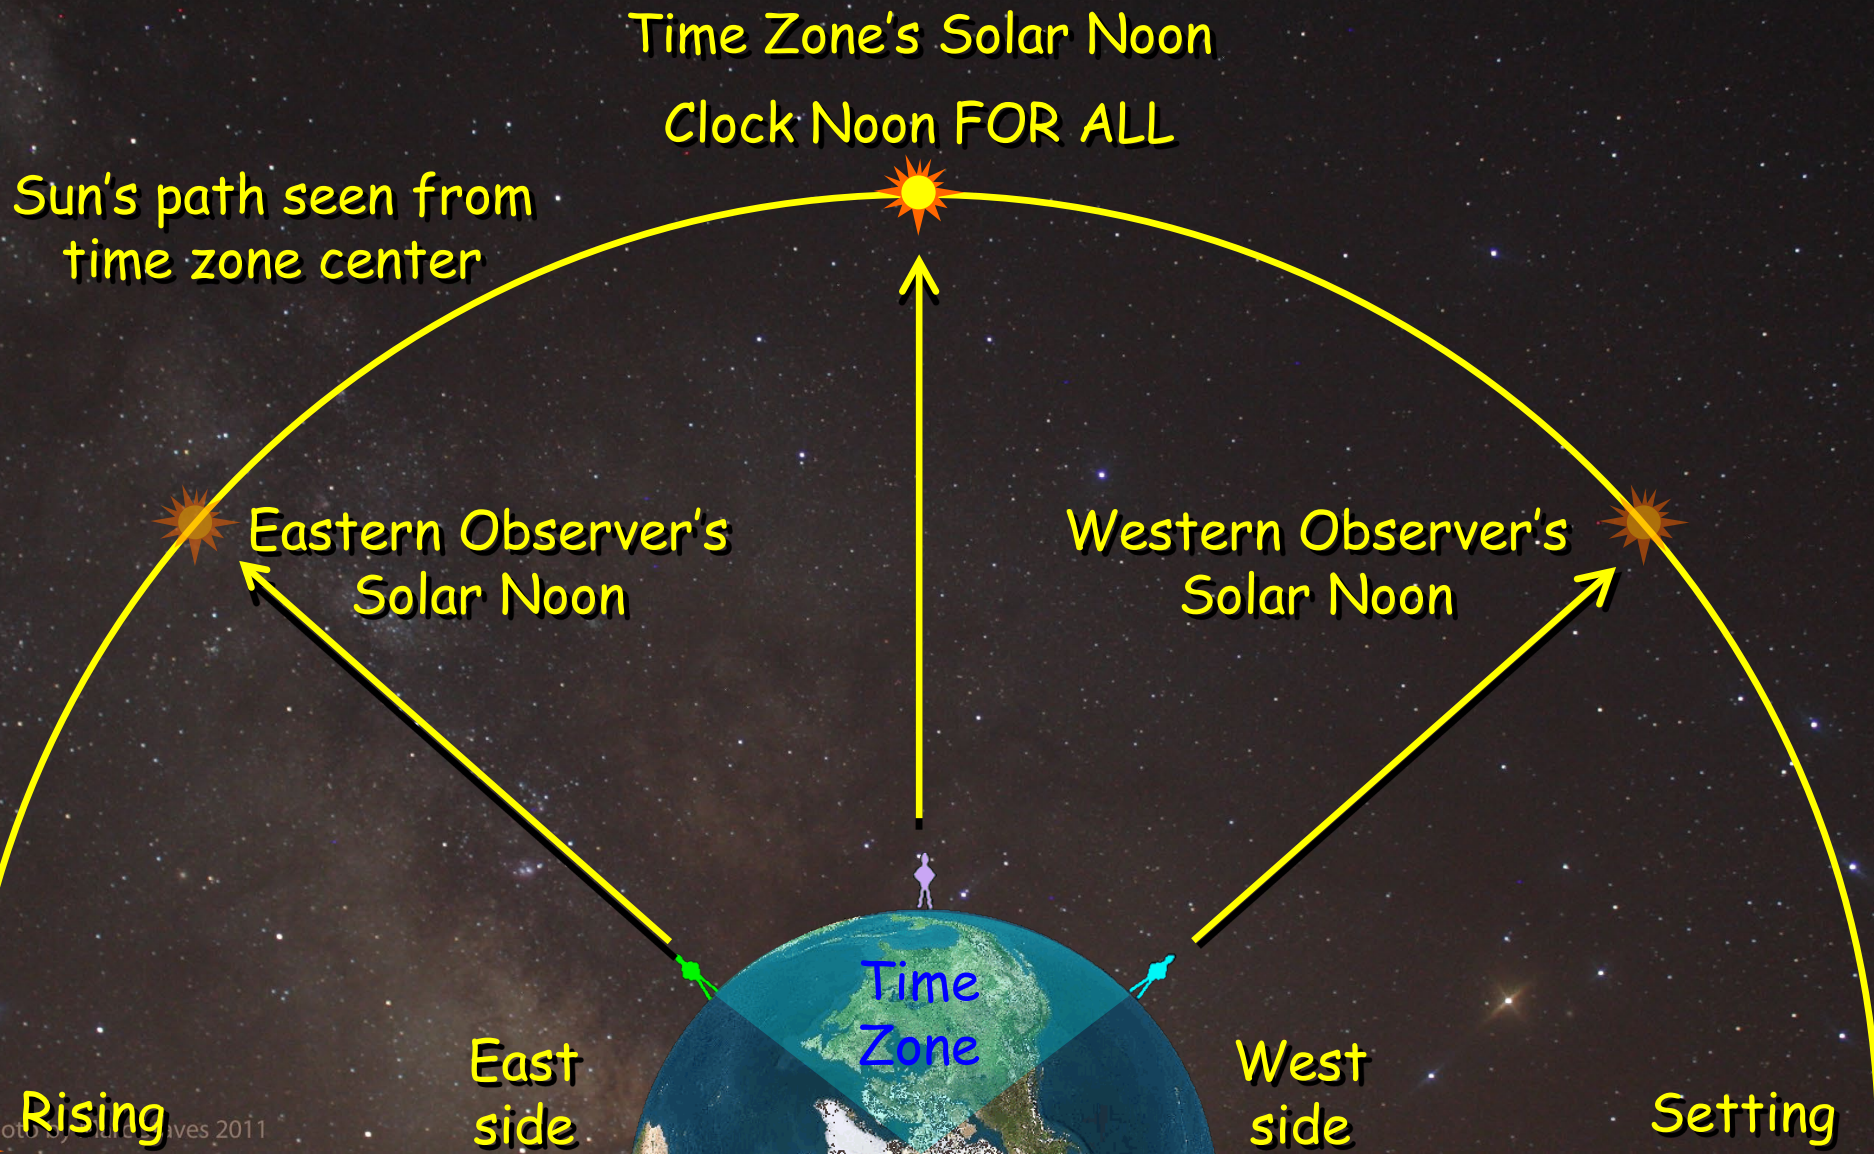

› eg. 2pm (14:00) EDT = 18:00 UT

U.S. Naval Observatory

Solar Time vs. Clock Time

☆ Solar time varies across time zones

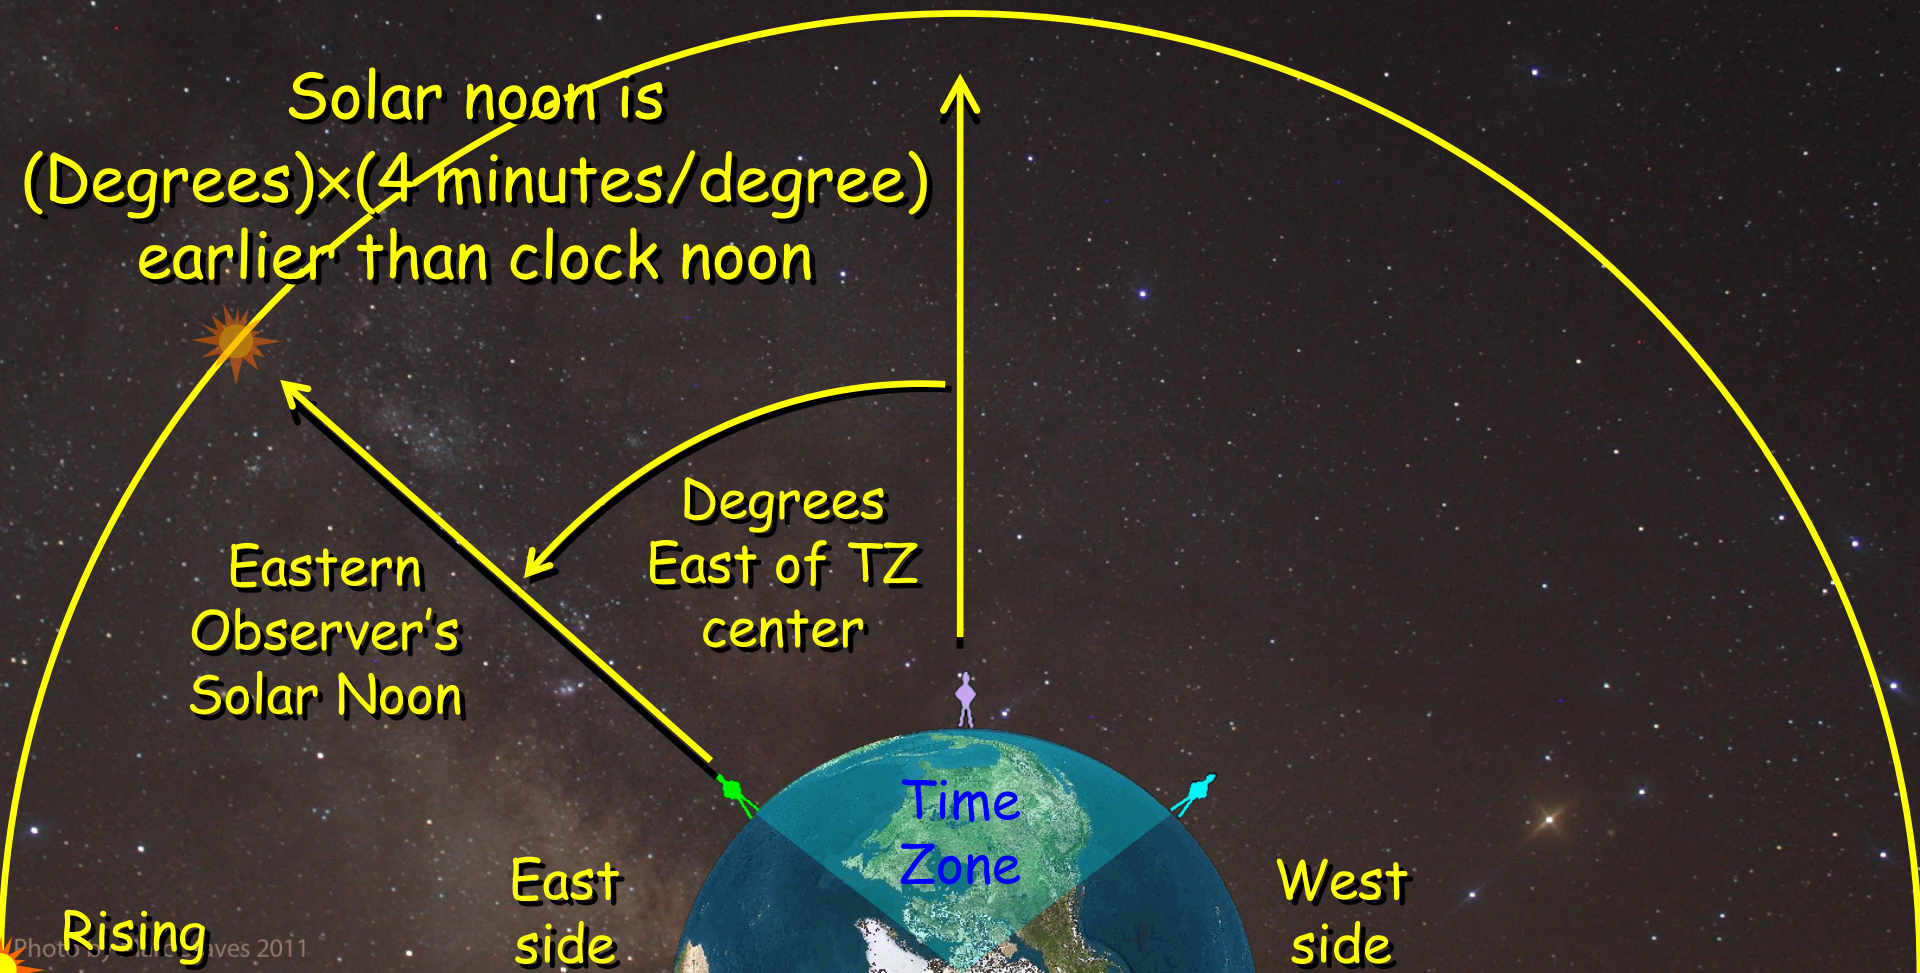

Solar Time vs. Clock Time

☆ Solar time varies across time zones

Time Zone's Solar Noon

Clock Noon FOR ALL

Question

Portland, Maine, 70° W is in the Eastern Time Zone (center: 75° W). Solar noon occurs at

$(\text{Degrees}) \times (4 \text{ minutes/degree}) = (5) \times (4) = 20 \text{ minutes early}$

Solar noon in Portland at 11:40 am

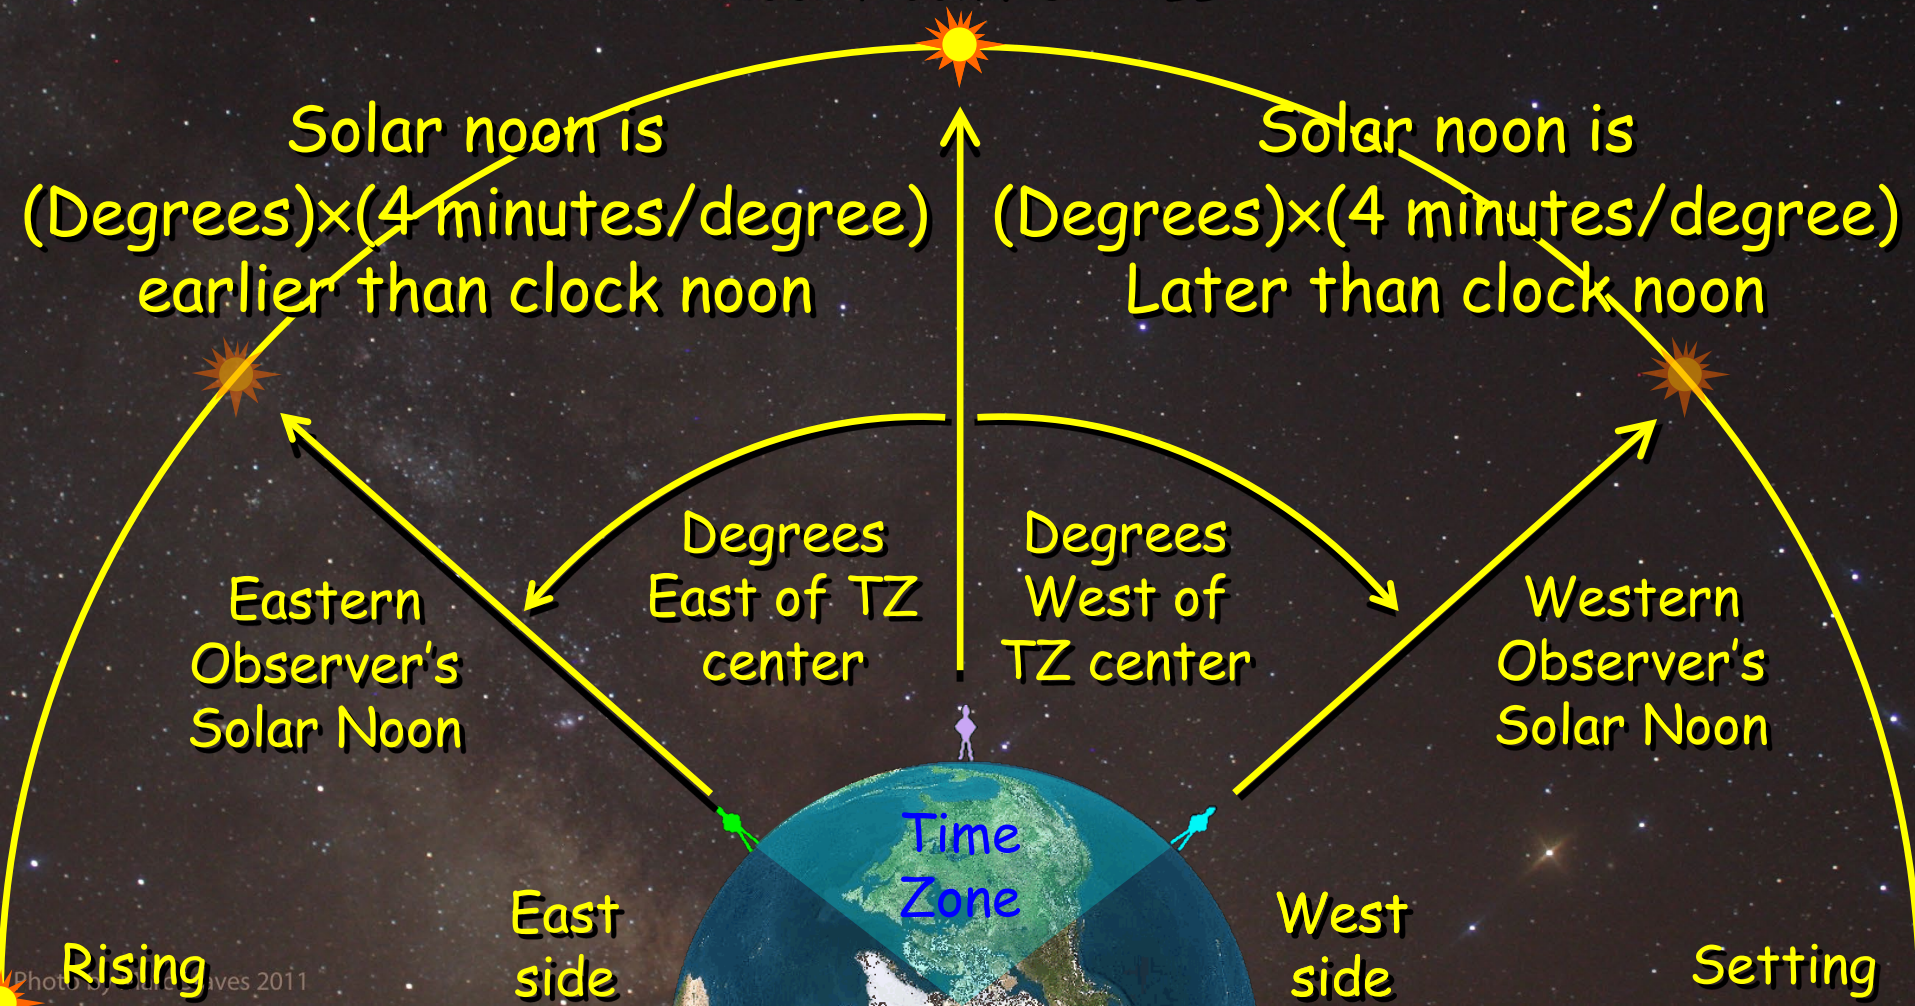

Solar Time vs. Clock Time

☆ Solar time varies across time zones

Time Zone's Solar Noon

Clock Noon FOR ALL

Question

Yuma, AZ, 115° W is in the Mountain Time Zone (center: 105° W). Solar noon occurs at

a) 11:20 am, b) 11:40 am, c) 12:20 pm, d) 12:40 pm

$(\text{Degrees}) \times (4 \text{ minutes/degree}) = (10) \times (4) = 40 \text{ minutes late}$

Celestial Navigation

☆ Finding Latitude & Longitude from

① Altitude of Polaris (NCP)

② Transit time of star

› Looked up in an ephemeris (eg. Field Guide)

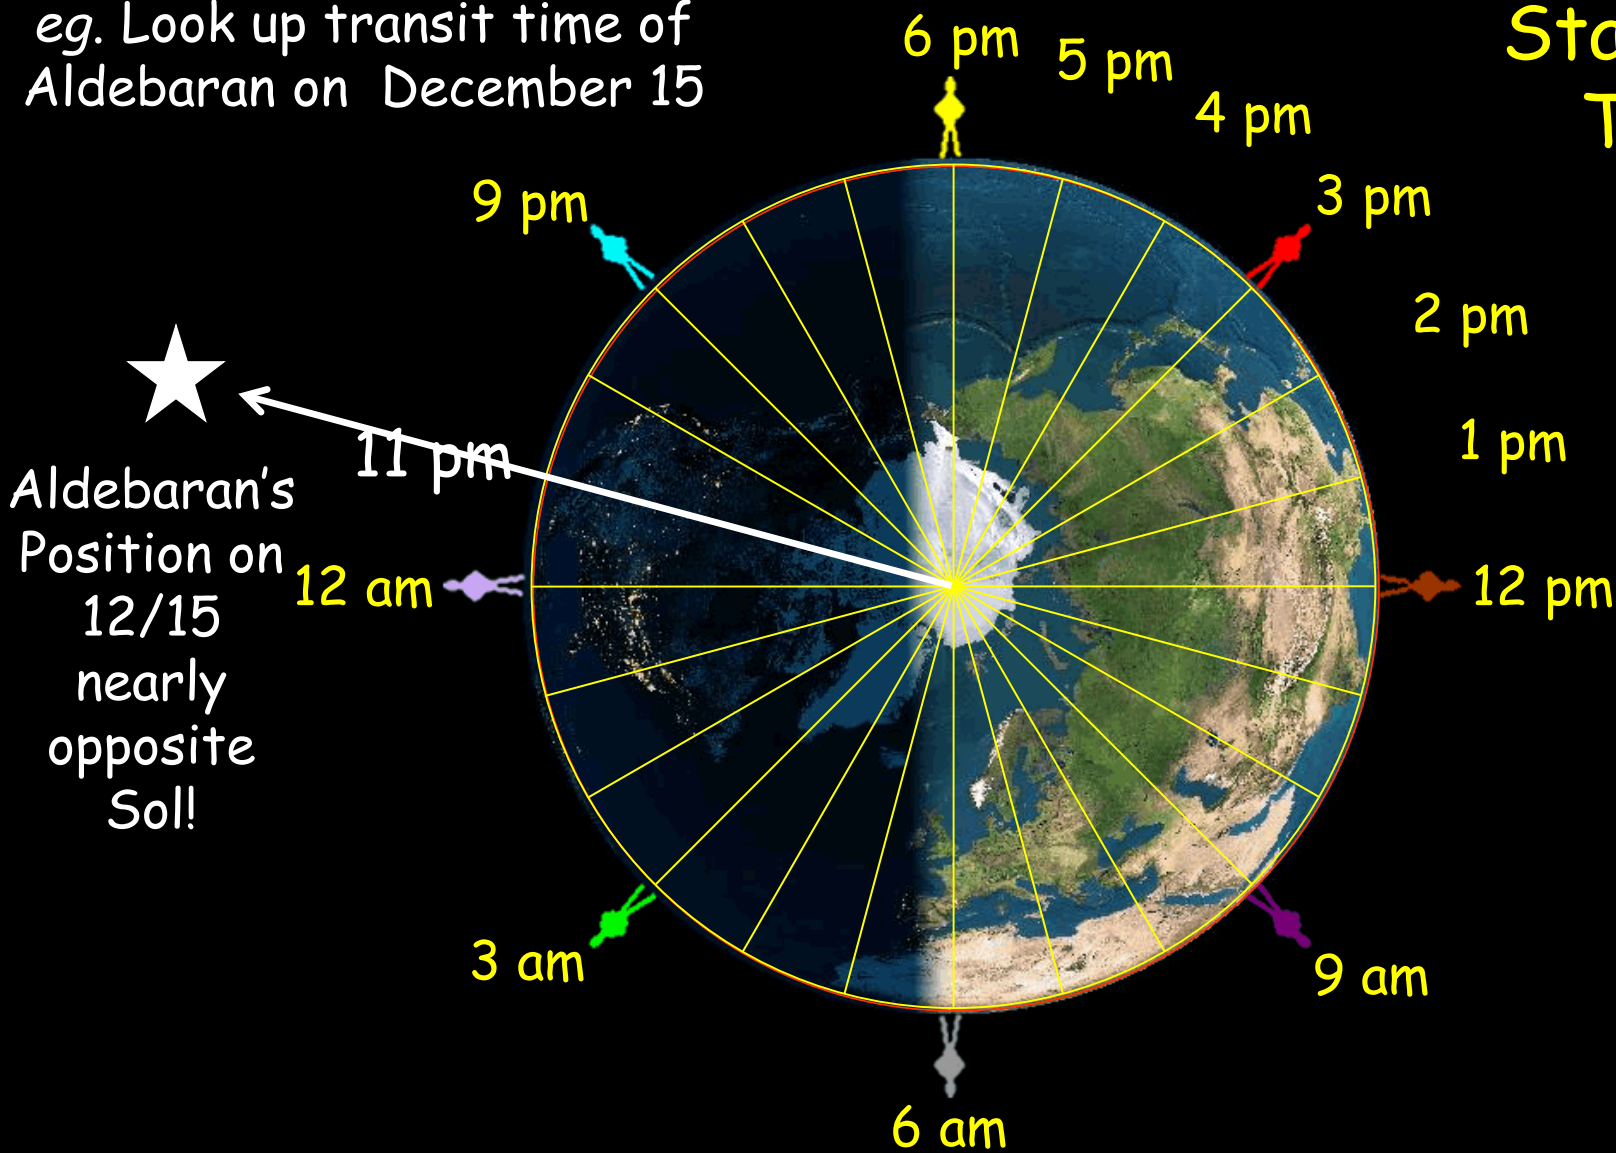

Star Transit Time

Gives position of star with respect to the sun

eg. Look up transit time of Aldebaran on December 15

Standard Time

Celestial Navigation

☆ Difference between observed and expected transit times gives longitude

Observer watches star transit.

Star's Transit

Clock's Time Zone Longitude

Clock is set to some time zone.

Observed transit time disagrees with ephemeris.

Longitude difference from clock's time zone center =
 $(\text{Time difference}) \times (15^\circ/\text{hour})$

Degrees East of TZ center

Celestial Navigation

☆ Example: Transit of Deneb on August 1 **Colorado Day!**

Observer sees Deneb transit at 11 pm EDT

At 1 am Deneb will transit TZ center at 75° W

Looks up transit time in FG

On 8/1 Deneb transits at 1 am

Early \Rightarrow East of TZ center

Longitude difference from clock's time zone center =
 $(2 \text{ hours}) \times (15^\circ / \text{hour}) = 30^\circ \text{ East}$

Observer's Longitude =
TZ center - Longitude difference =
 $75^\circ \text{ W} - 30^\circ = 45^\circ \text{ W}$

Navigation Challenge

- ☆ Try it on your own with handout
- ☆ See you next week!
- ☆ Slides will be available at
