

TIME ZONES

24 hours = 360 degrees³

1 hour = 15 degrees

1 degree = 4 minutes

1 TIME ZONE = 15 DEGREES OF LONGITUDE

Starting at the Prime Meridian list the longitudes of the centers of western time zones:⁶

Name	Center Longitude
W. European	0° W
W. African	15° W
Azores	30° W
Brazilian	45° W
Atlantic	60° W
Eastern	75° W

Name	Center Longitude
Central	90° W
Mountain	105° W
Pacific	120° W
Yukon	135° W
Alaska-Hawaiian	150° W
Nome	165° W

The times of astronomical events are often given in **COORDINATED UNIVERSAL TIME (UT OR UTC)¹**, which is the time on the prime meridian (Greenwich, or Western European Time). The official time-keeper of the United States is the Time Service Department at the US Naval Observatory (www.cnmc.usff.navy.mil/usno/). Find the EST or EDT of the following events in the Spring of 2024 using the conversions:¹²

EST = UT - 5^h *Note that some of the dates may change if an event occurs between midnight UT and Eastern time*
 EDT = UT - 4^h

EST to EDT on March 10!

EVENT	UT		LOCAL TIME (EDT OR EST)	
	Date	Time (24 hr)	Date	Time (h:m AM/PM)
Full (Snow) Moon	February 24	12:30	Feb. 24	7:30 am EST
Vernal Equinox	March 20	3:04	March 19	11:04 pm EDT
Full (Flower) Moon	May 23	13:53	May 23	9:53 am EDT
June Solstice	June 20	20:50	June 20	4:50 pm EST

¹ Replaced Greenwich Mean Time (GMT) as the World standard for time in 1986. Also known as "Zulu Time," it is based on atomic measurements rather than the Earth's rotation. Greenwich Mean Time (GMT) is still the standard time zone for the Prime Meridian (Zero Longitude). Also, UTC is not the official time in any actual time zone. (www.timeanddate.com/time/gmt-utc-time.html)

Clock and Solar Noon

The **clock time** is the local clock time. Due to the finite width of the time zones, it does not always fit the solar meaning of time.

SOLAR NOON = SUN ON OBSERVER'S MERIDIAN (TRANSIT)

On the time zone center longitude, clock noon corresponds (roughly) to solar noon. For each degree of longitude of difference between your location and the center meridian, there will be four minutes of difference between your solar noon and civil noon.

EAST OF TZ CENTER: SOLAR NOON before civil noon.
WEST OF TZ CENTER: SOLAR NOON after civil noon.

Thus solar noon occurs early in the eastern part of the time zone and late in the western part of the time zone. Complete the following table by calculating the difference between the city's longitude and that of the time zone center and using 1 hour = 15° and 1 min = 15'.

City	Longitude				Solar Noon	
	City	Time Zone Center	Difference Deg. & min.	E or W	Early or Late	Clock Time
Canton, NY	75°10' W	75° W	10'	W	Late	12:00:40 pm
Portland, ME	70°15' W	75° W	4° 45'	E	Early	11:41 am
Thunder Bay, Ontario	89°15' W	75° W	14° 15'	W	Late	12:57 pm
Lhasa, Tibet (CCT: UTC + 8)	91° E	120° E	29°	W	Late	1:56 pm

↔ Longitude is measured **west to east** in the eastern hemisphere! **Use a globe!**
