PLANETARY POSITIONS WITH RESPECT TO THE SUN:

Use appendix 11 in the Field Guide for September 15, 2009 to complete the following table:

<table>
<thead>
<tr>
<th>Object</th>
<th>Planetary Longitude</th>
<th>Atlas Chart #</th>
<th>Constellation</th>
<th>Elongation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sol (☉)</td>
<td>173</td>
<td>27</td>
<td>Leo</td>
<td>ZERO!</td>
</tr>
<tr>
<td>Mercury (☿)</td>
<td>183</td>
<td>27</td>
<td>Virgo</td>
<td>10° E</td>
</tr>
<tr>
<td>Venus (♀)</td>
<td>144</td>
<td>26</td>
<td>Cancer</td>
<td>29° w</td>
</tr>
<tr>
<td>Mars (♂)</td>
<td>103</td>
<td>12</td>
<td>Gemini</td>
<td>70° w</td>
</tr>
<tr>
<td>Jupiter (♃)</td>
<td>318</td>
<td>32</td>
<td>Capricornus</td>
<td>145° E</td>
</tr>
<tr>
<td>Saturn (♄)</td>
<td>175</td>
<td>27</td>
<td>Virgo</td>
<td>2° E</td>
</tr>
</tbody>
</table>

PLANETARY POSITIONS IN THE SKY

The diagram below shows an observer looking south at sunset. From the planetary longitude of the sun and planets above, show where the planets will be in the observer's sky (some may be below the horizon). Discuss how these positions correspond to the times the planets will be visible to this observer (e.g., after sunset, before sunrise or most of the night).
**Planetary Positions in the Solar System**

A view of the solar system as seen FROM ABOVE THE NORTH ECLIPTIC POLE with the sun in the center is shown below. The line from the Earth (●) to the sun (☉) represents the planetary longitude of the sun. For each of the five visible planets,

1) **Center a protractor on the Earth**, measure the elongation angle from the sun’s longitude.

2) Use a ruler to determine where this crosses the orbit of the planet you’re plotting, and mark the planet’s position on its orbit.

**Special Note:** Can you be certain where Mercury and Venus are in their orbits? How many positions for each planet are possible? What information will help you figure this out?

3) Describe the any interesting planetary configurations (i.e., at or near defined configurations)

---

**Sol’s Planetary Longitude:** 173°

---

**Eastern Elongation**

- **Saturn:**
  - 175° - 173° = 2° E
  - Nearing superior conjunction

- **Mercury:**
  - 183° - 173° = 10° E
  - Nearing Inferior Conjunction

- **Jupiter:**
  - 318° - 173° = 145° E

**Western Elongation**

- **Venus:**
  - 173° - 144° = 29° W

- **Mars:**
  - 173° - 103° = 70° W

Center protractor on Earth!
