

## HOMEWORK SET 14: ELECTRON CONFIGURATIONS

Due Friday, March 26, 2025

Problems adapted from TZDII<sup>1</sup>

**10.15)** Draw four energy-level diagrams like TZDII Fig. 10.7 showing the ground states of  ${}^5\text{B}$ ,  ${}^9\text{F}$ ,  ${}^{10}\text{Ne}$ , and  ${}^{11}\text{Na}$ .

**FIGURE 10.7**

Excitation of beryllium ( $Z = 4$ ) requires only 2.7 eV to lift one of the  $2s$  electrons to the nearby  $2p$  level. In the excited state the spins of the  $2s$  and  $2p$  electrons can point either way.

**10.17)** In the plot of ionization energy against atomic number, it is clear that within each shell, the ionization energy tends to increase with  $Z$ . However, there is a small drop as one moves from  ${}^4\text{Be}$  to  ${}^5\text{B}$  and another from  ${}^7\text{N}$  to  ${}^8\text{O}$ . Explain these drops.

**10.32) a)** Find the ground state configurations of nickel and copper from the periodic table you were given (or inside TZD back cover).

**b)** Draw an energy-level diagrams similar to TZDII Fig. 10.7 to illustrate these two ground states. Do you think the electron configuration of copper may contribute to its electrical conductivity? Explain. (NOTE: GENERALLY, THE  $4s$  LEVEL IS FILLED BEFORE THE  $3d$  LEVEL, HOWEVER, THE  $4s$  AND  $3d$  LEVELS ARE VERY CLOSE SO THAT THE  $4s$  CAN LOSE AN ELECTRON TO THE  $3d$  AS OCCURS IN COPPER.)

THE 2019 NOBEL PRIZE IN CHEMISTRY WENT TO THE TEAM THAT DISCOVERED THE ELEMENTS IN THE BIG GAP AT THE TOP OF THE PERIODIC TABLE.
